

// SECTION 01 • SKILL PACK

UNHINGED SKILLS

Twenty-five Claude Code skills with names that sound like a police report and uses that save real hours. Cheaper agent runs, deeper audits, leaner systems, faster shipping, scrappy fixes, and specs Claude can actually build from.

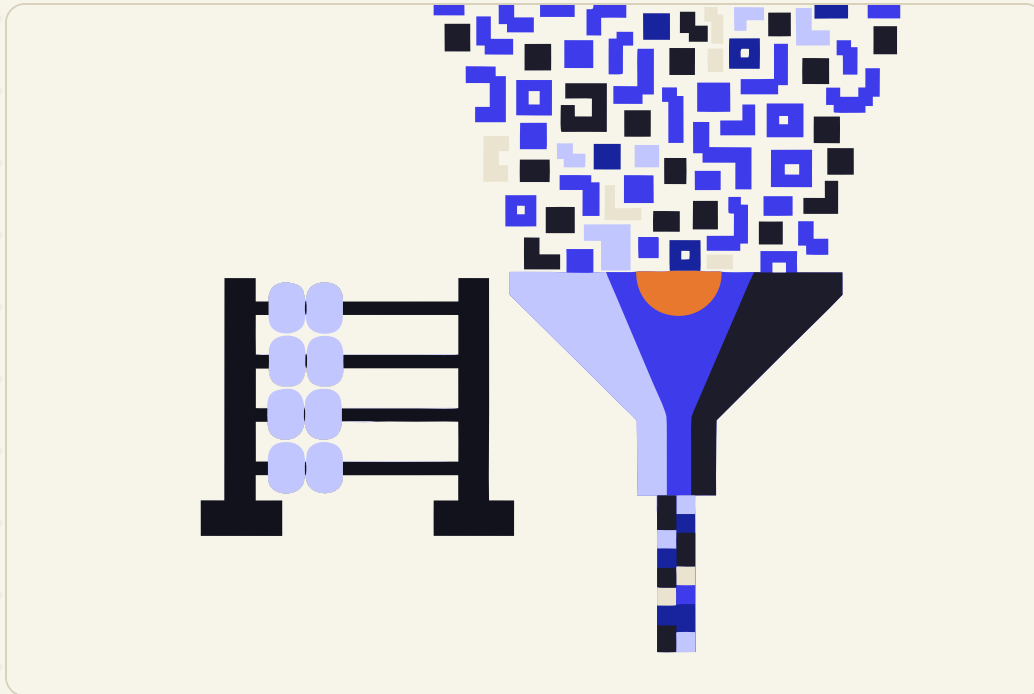

```
> boot opusjake_os
> resource: unhinged-claude-skills
> version: v1.0 • 2026
> status: ready_
```

The names are bait. Underneath each one is a real workflow I lean on inside Claude Code. Twenty-five of them. The first five get the full breakdown with a picture each. The other twenty are the rapid-fire arsenal: speed modes, scrappy fixes, focus states, and cost hacks. Steal the ones that fit how you work.

CHINESE GRANDPA

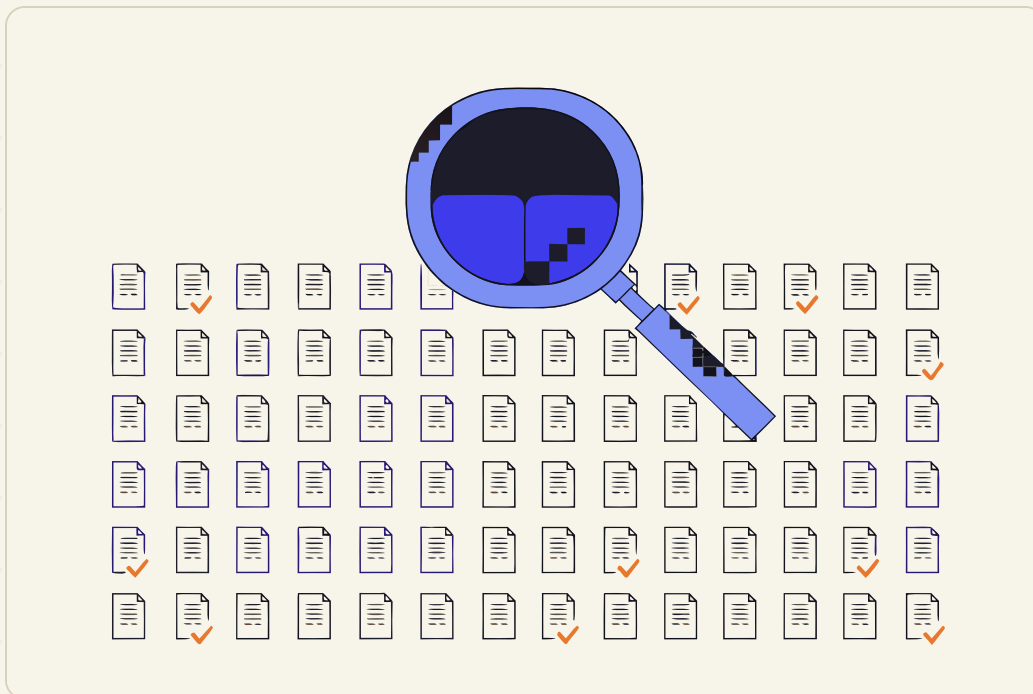

Type `/chinese-grandpa` and it translates your prompt into Mandarin before it reaches your sub-agents. Same instructions, fewer tokens, because Mandarin carries more meaning per character. Long briefs compress hard, so big agent runs get cheaper and faster without losing the original intent.

Use it when you are pushing long, repeated instructions to a fleet of sub-agents and the token bill keeps climbing.

WEAPONIZED AUTISM

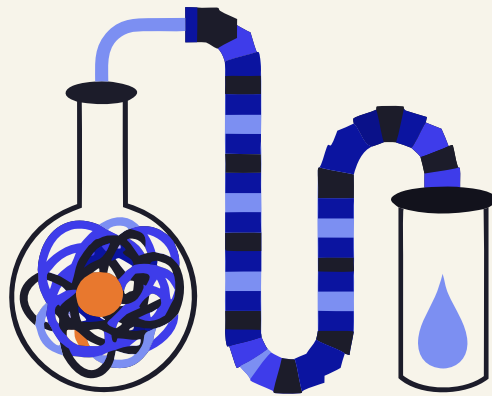

Type `/weaponized-autism` and Claude turns into an obsessive detail machine. It reads every file, checks every edge case, questions every assumption, and chases every dependency before it answers. Slower on purpose, and far harder to fool.

Use it when you are debugging, auditing, or researching and a confident-but-wrong answer would cost you.

METH LAB

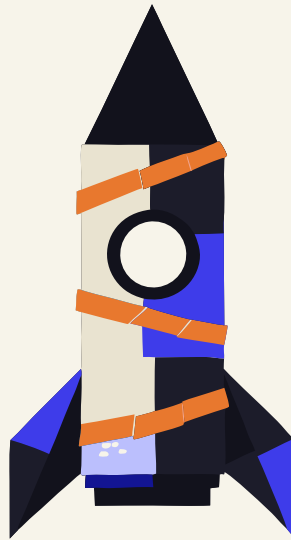

Type `/meth-lab` and Claude becomes a workflow optimizer. Hand it a messy system, a bloated prompt, a broken automation, or a slow process, and it strips the thing down to the fastest, cheapest, cleanest version that still works.

Use it when something technically runs but feels heavy, expensive, or held together with tape.

DIVORCED DAD

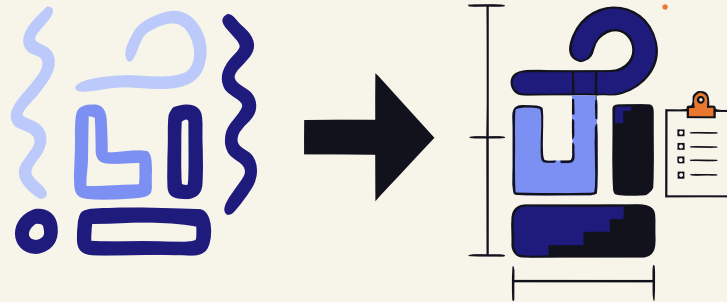

Type `/divorced-dad` and Claude stops gold-plating. It builds the simplest functional version first, skips the overengineering, and ships something you can use today. Working beats perfect, and perfect was never shipping anyway.

Use it when you do not need pretty, you need it live by tonight.

REDNECK ENGINEER

Type `/redneck-engineer` and Claude turns a vague idea into a clear build plan. You get a short PRD, a task list, user flows, constraints, and acceptance criteria, so Claude Code knows exactly what to build instead of guessing its way there.

Use it when you know what you want in your head but Claude keeps building the wrong thing.

SHIP IT ANYWAY

Scrappy execution. When you need a working thing, not a pretty one.

`/duct-tape-dev` ships the quick patch that unblocks you now and flags it clearly as debt to revisit later.

`/gas-station-genius` solves it with whatever is already in the repo. No new libraries, no installs, a fix from the parts on hand.

`/macgyver` improvises from primitives. Standard library and cleverness instead of reaching for a new framework.

`/apollo-13` works a critical failure under hard constraints. Limited options, no clean fix, get the broken thing home with what you have.

`/cowboy-coder` makes the judgment calls itself and keeps moving instead of pausing at every fork. Fast and opinionated, best on low-stakes work.

`/questionable-engineering` picks the solution that works over the one that is technically correct. Pragmatic, slightly cursed, perfect for prototypes.

`/goblin-mode` gets it working ugly first. No naming debates, no structure until the structure earns its place.

FULL SEND

Speed, chaos, and endurance. For when the clock is the only constraint that matters.

`/speedrun` finds the shortest path to done and takes it. No detours, no nice-to-haves.

`/autopilot-chaos` takes the whole task and runs it end to end without stopping to ask. You review at the finish line.

`/rage-compile` attacks the error list in one pass. Fix, rebuild, repeat, no commentary, until it builds clean.

`/panic-mode` triages a live incident. Stop the bleeding first, smallest safe fix next, post-mortem once it is stable.

`/zero-sleep` settles in for the long haul and holds the thread across a big multi-step build without losing the plot.

`/sleep-deprived-founder` cuts the backlog to the one or two things that actually move the needle and ignores the rest.

`/crackhead-energy` fires out ideas at full speed. Twenty rough directions in a minute, you cherry-pick the good ones after.

`/caffeine-overdose` goes wide and exhaustive. Every option, every edge, every step spelled out. The opposite of the compressor.

FERAL FOCUS

Heads-down modes, deep digs, and a couple of cost hacks.

`/feral-goblin` drops the small talk and goes heads-down. No preamble, just code and short status lines until it is done.

`/keyboard-gremlin` makes the smallest possible change. Surgical edits, minimal diff, nothing touched that did not need it.

`/basement-hacker` goes underground. Reverse-engineers the internals, reads the source nobody reads, and explains how it actually works.

`/schizotech` connects the dots nobody asked it to. Wild, lateral architecture ideas that link things you would never pair on purpose. Filter heavily.

`/tax-fraud` hunts cost everywhere. Trims tokens, kills redundant calls, reports the cheapest way to the same result. Aggressive optimization, technically legal.

RUN THE STACK

Twenty-five names, one idea: a label you will remember wrapped around a real mode. Here are the five to start with, then build out the rest.

WHEN YOU ARE...	REACH FOR
Paying too much for big multi-agent runs	/chinese-grandpa
Debugging or auditing something high-stakes	/weaponized-autism
Cleaning up a bloated or broken system	/meth-lab
Shipping a first working version fast	/divorced-dad
Turning a fuzzy idea into a real build	/redneck-engineer

These are custom skills, not built-ins. In Claude Code, drop a short `SKILL.md` in your skills folder for each one: the name, when it should trigger, and the behavior you want. No time to set them up? Paste the same instruction at the top of a chat as a mode and you get most of the effect. Either way, the name is the joke and the saved hours are the point.
